Algorithm

Algorithm

마방진 (Magic Square)

- 홀수만 처리 가능!

```
int size = 5;

int[][] arr = new int[size][size];
int middle = size/2;

int i=0, j=middle;
for(int num=1 ; num<=size*size ; num++) {
    arr[i][j] = num;
  //행 감소
    i--;
    if(i < 0)
        i = size-1;
  //열 증가
    j = (++j)%size;
  //아래 표현과 같다.
    /*j++;
    if(j >= size)
        j = 0;*/

   //배수이면 행은 1 증가, 열은 그대로
    if(num%size == 0) {
        i = (i+2)%size;
        j--;
        if(j < 0)
            j = size-1;
    }
}
```

합병 정렬 (Merge Sort)

Merge Sort

이진 탐색 (Binary Search)

- A ≤ X ≤ B 조건을 검색. (반환값이 index+1 이므로)

```
    public static int binarySearch(ArrayList<Integer> list, int target) {

        int left = 0;
        int right = list.size() - 1;
        int middle = 0;
        while(left <= right) {
            middle = (left + right) / 2;
            if(target < list.get(middle)) {
                right = middle - 1;
            }
            else {
                left = middle + 1;
            }

            if(list.get(middle) <= target && middle < list.size() - 1) {
                if(target < list.get(middle + 1)) {
                    return list.get(list.size() > middle + 1 ? middle + 1 :
list.size() - 1);
                }
            }
        }
        return -1;
    }
```
